

Web Store Server Requirements

To find out if your server meets the requirements of LightSpeed’s Web Store, configure the Setup tab of the Web Store setup panel at **Tools > Web Store > Setup**. Next, click the *Server Test* button to send a test file (test.php) to your web server. This file tests for the specific server requirements, returning with a message indicating the web server meets the requirements or, if not, which requirements were not met.

If the requirements are not met, you will see a button that will automatically send a link to the support department of Xsilva of a page listing the unmet items, in order to help us make recommendations on server configuration or to help determine if moving servers is required. You do not need a Web Store license to use the Server Test button, and the button is also available in the demo version of LightSpeed.

IMPORTANT:

- 1 No Web Database database is required. The Web Store uses data stored in flat PHP files.
- 2 The LightSpeed Web Store requires an Apache web server running on a *nix environment. It will not run on Windows Server/ IIS platform.

Your web server does not the LightSpeed Web Store requirements.

```
Session.bug_compat_warn should be disabled.  
Session.auto_start should be enabled.
```

- 3 The LightSpeed Web Store requires PHP 5.2 or later with CURL Library installed, as well as SSH, and the PECL JSON extension. These are standard modules and most web hosts are able to set up your PHP environment to meet these requirements.
- 4 The LightSpeed Web Store may require access to setting PHP directives. Typically, this can be done by editing the `php.ini` file located on your web server, or by creating one for the Web Store directory or through the `.htaccess` file.
- 5 Due to the vast assortment of possible server configurations, Xsilva cannot guarantee that Web Store will run on every host. We have experienced ongoing issues with servers that run the pureFTP FTP server or any server that does not allow you to set PHP directives.
- 6 Web Store will not work with the following hosts:
 - Network Solutions (networksolutions.com)**
- 7 Xsilva recommends the following hosts:
 - HostMonster (hostmonster.com)**
